

1. Reductions

$$(a) \quad x + y = \frac{(x+y)^2 - x^2 - y^2}{2} \Rightarrow \text{multiplication} \leq \text{squaring}$$

$$(b) \quad y^2 = 4xy \Rightarrow \text{squaring} \leq \text{multiplication}$$

$$(c) \quad \frac{1}{x} - \frac{1}{y} = \frac{y-x}{xy} \Rightarrow \text{if } y = x+1 \quad \frac{1}{x} - \frac{1}{x+1} = \frac{1}{x^2+x} \Rightarrow x^2 = \frac{1}{\frac{1}{x} - \frac{1}{x+1}} - x$$

(d) according to (a) (b) multiplication & squaring are equal
 but we can't reduce reciprocal from squaring $\Rightarrow \text{squaring} \leq \text{reciprocal}$

2. Lucas Numbers

$$L_n = L_{n-1} + L_{n-2}, L_0 = 2, L_1 = 1 \Rightarrow L_2 = 3, L_3 = 4, \dots$$

$$F_n = 0 \ 1 \ 1 \ 2 \ 3 \ 5 \ 8 \dots$$

Fibonacci is in $P(O(1.618)^n)$

$$L_n = 2 \ 1 \ 3 \ 4 \ 7 \ 11 \dots$$

L_n is reducible to F_n

$\Rightarrow L_n$ is in $P \because F_n$ is in P

$\Rightarrow L_n$ runs poly time in K

3. (a) assume x is positive integer

$$x^2 - x - 1 = 0$$

$$x(x-1) = 1$$

\Rightarrow we cannot find a positive integer that can satisfy both $x=1$ & $(x-1)=1$

\Rightarrow no positive integer solutions

(b) assume $x = \frac{p}{q}$

$$\Rightarrow \frac{p^2}{q^2} - \frac{p}{q} - 1 = 0$$

$$p^2 - pq - q^2 = 0$$

$$\therefore \text{GCD}(p, q) = 1$$

$\therefore p$ & q cannot be even in the same time

$$(p, q) = (\text{odd}, \text{odd}) \Rightarrow \text{odd} - \text{odd} - \text{odd} \Rightarrow \text{odd}$$

$$(p, q) = (\text{odd}, \text{even}) \Rightarrow \text{odd} - \text{even} - \text{even} \Rightarrow \text{odd}$$

$$(p, q) = (\text{even}, \text{odd}) \Rightarrow \text{even} - \text{even} - \text{odd} \Rightarrow \text{odd}$$

contradiction

\Downarrow

no rational solution

$$4. A(n) = A(n-1) + 1 + \frac{2}{n}$$

best: $n-1$

$$\Rightarrow A(n) = (n-1) + \sum_{j=1}^n \frac{2}{j}$$

worst: $2(n-1) \Rightarrow$ near best

$$= (n-1) + 2 \log n + \text{const}$$

$$5. F(x, n, \text{MAX}, \text{MIN})$$

$$T(n) = 2T\left(\frac{n}{2}\right) + 2$$

if $n=1$, $\text{MAX} = x[0]$, $\text{MIN} = x[0]$

if $n=2$, if $x[0] > x[1]$

$\text{MAX} = x[0]$, $\text{MIN} = x[1]$

else $\text{MAX} = x[1]$, $\text{MIN} = x[0]$

if $n > 2$, split x into A, B

$F(A, \frac{n}{2}, \text{MAXA}, \text{MINA})$

$F(B, \frac{n}{2}, \text{MAXB}, \text{MINB})$

compare(MAXA , MAXB)

compare(MINA , MINB)

$$= 2^k T\left(\frac{n}{2^k}\right) + \frac{2(1-2^k)}{1-2}$$

$$= 2^k T\left(\frac{n}{2^k}\right) + 2 \cdot 2^k - 2$$

$$\text{let } 2^k = \frac{n}{2}, 2^{k+1} = n, k = \log n - 1$$

$$\Rightarrow T(n) = \frac{n}{2} \cdot T(2) + 2 \cdot \frac{n}{2} - 2$$

$$\therefore T(2) = 1$$

$$\therefore T(n) = \frac{3}{2}n - 2$$

6. (a) assume $E(x_1, x_2, \dots, x_n)$ is satisfiable

$\text{FIND}(D(x_1, x_2, \dots, x_n), i) \{$

set $D(x_i) = 1$

if $YS(D) = \text{YES}$

$D(x_i) = 1$

else $D(x_i) = 0$

call $\text{FIND}(D, i+1) \}$

$$(b) \text{FIND}(n) = \text{FIND}(n-1) + O(n^k)$$

$$= \text{FIND}(1) + n \cdot O(n^k)$$

$$\Rightarrow \text{FIND}(n) = O(n^{k+1})$$

7.

8.

(a)

① HP is NP

② $HC \leq HP$

$G: u, v_1, v_2, \dots, v_n$

$G': u, v_1, v_2, \dots, v_n, w$

(b)

① $HC \in NP$

② $HP \leq HC$

$G: v_1, v_2, \dots, v_m$

$G': u, v_1, v_2, \dots, v_m$

(c) ① $TSP \in NP$

we can find a poly time algorithm according to www.slideshare.net/enrecaaku/cukoglu/tsp-is-np-complete
this algorithm is $O(n)$

② $HC \leq_p TSP$

$G(V, E)$

\Rightarrow

$G'(V, E')$

Convert G to $G' = (V, E' = V \times V, d)$
 $B = 0$ of TSP

$d_{G,G'} = \begin{cases} 0 & \text{if edge } (G_i, G_j) \in E, \\ 1 & \text{otherwise} \end{cases}$

Time of reduction is $O(n^2)$: poly time

9. let x be G_1 & G_2 and y be $\{1, 2, \dots, n\}$

An algorithm $A(x, y)$ verifies graph-isomorphism by:

(a) check y is a permutation of $\{1, 2, \dots, n\}$

if no, return false,

else continue

(b) permute the vertices of G_1

verify the permuted G_1 is identical of G_2

$\left. \begin{array}{l} \text{step (a)} = O(V^2) \\ \text{step (b)} = O(V+E) \end{array} \right\} \Rightarrow A \text{ runs } O(V^2) \Rightarrow \text{graph-isomorphism} \in \text{NP}$

10. (a.)

	V_1	V_2	V_3
V_1	0	1	0
V_2	1	0	1
V_3	0	1	0

	V_1	V_2	V_3
V_1	0	0	1
V_2	0	0	1
V_3	1	1	0

$$C_N = 001, 001, 110 = 78$$

(b) C_N is easy

$C_N(G_1) = C_N(G_2)$ is easy, too.

The 2 C_N is different & not isomorphic if I know C_N

\Rightarrow we can know where they are isomorphic

\rightarrow If find the C_N of a graph is easy

\Rightarrow graph isomorphism is easy

(c) if x is the number after unroll ^{G} and is binary

if $I > x$, I must bigger than C_N

$x < C_N$ & $I \leq x$ & $I \leq C_N$

\therefore it is easy to say "No" that $I < C_N$.

$\because x$ is n^2 bits

\Rightarrow the unroll operation can be finished in poly time

\Rightarrow Is-Canonical is in Co-NP

11. ① show $T \in \text{CoNP}$ ② show $\overline{\text{SAT}} \leq_p T$

① $T \in \text{CoNP}$ if $\overline{T} \in \text{NP}$

$\overline{T} = \{ E(x_1, \dots, x_n), \text{ st. there is some assignment to the variables such that } E(x_1=a_1, \dots, x_n=a_n) = \text{FALSE} \}$

$\overline{T} \in \text{NP}$ because the "magic" guess will provide the assignment, that we can verify in poly time

② $\overline{\text{SAT}} \in \text{CoNP-complete}$

$\overline{\text{SAT}} = \{ E \mid E \text{ is not satisfiable, (or FALSE } \forall \text{ assignment)} \}$

we want $\overline{\text{SAT}} \leq_p T$

$E(x_1, \dots, x_n) \xrightarrow{\text{"negate"}} \boxed{\text{not } E} \rightarrow \text{instance of } T$

De Morgan Law: $\overline{A \cup B} = \overline{A} \cap \overline{B}$
 $\overline{A \cap B} = \overline{A} \cup \overline{B}$

$$\overline{(x \vee y \vee z \vee u \vee w)} = \overline{x} \wedge \overline{(y \vee z \vee u \vee w)} = \overline{x} \wedge \overline{y} \wedge \overline{(z \vee u \vee w)} = \overline{x} \wedge \overline{y} \wedge \overline{z} \wedge \overline{u} \wedge \overline{w}$$

① + ② $\Rightarrow T$ is CoNP-complete.

12.

① 3SAT is NP since any assignment of variables can be verified in poly time.

② SAT is NP-Complete

$$\text{SAT} \leq_p \text{3SAT}$$

SAT problem $(x \vee \bar{y} \vee z \vee \bar{w} \vee u) \dots$

$$(\overline{x \vee \bar{y} \vee z \vee \bar{w} \vee u}) \wedge (\bar{a}_1 \vee z \vee a_2) \wedge (\bar{a}_2 \vee \bar{w} \vee u)$$

$\begin{cases} m \text{ variables } (m \geq 3) \\ m-2 \text{ clauses} \\ m-3 \text{ dummy variable} \end{cases}$

① if the SAT instance is satisfiable then corresponding 3SAT instance is satisfiable

② if 3SAT instance is satisf. \Rightarrow SAT inst. is satisfiable.
